KINECHEK SLIMLINE MODEL (1 ___)

CLAMPING AREAS AND MOUNTING ARRANGEMENTS

FIGURE 6

The KINECHEK can be mounted on flat surfaces with mounting blocks at either snap ring groove. Use a spacer for intermediate positioning. Minimal thrust is absorbed by the snap ring as it is held in place by the vice tension of the mounting blocks. (FIGURE 6)

FIGURE 7

For light-duty applications, it can be mounted in round unthreaded holes and retained by snap rings. Thrust is taken by the front snap ring. (FIGURE 7) Do NOT use set screws. Clamping is ONLY permissible on areas of the unit indicated in blue in FIGURES 1, 3, 5, & 8, or else damage may occur.

CLAMP AREA FOR SLIMLINE KINECHEK MODELS

FIGURE 8

! IMPORTANT NOTE: The unit body must NOT be ground down or altered in any way to fit clamping fixture. Doing so will void the warranty. A custom fixture should be designed to fit the body diameter or you may order proper mounting blocks from your Deschner distributor.

PROPER INSTALLATION AND ALIGNMENT RESTRICTIONS

An alignment angle of 90 degrees is ideal to prevent rod rotation and damage to the internal diaphragm seal. (FIGURES 9 & 10) Operations where alignments are NOT at right angles can expect a shorter life span of the unit.

FIGURE 10

! IMPORTANT NOTE: KINECHEKS are not designed to serve as impact absorbers. Free travel prior to impact should be minimalized. See the Deschner catalog for Shock Absorber solutions. NEVER adjust while in operation or while the rod is pressed in. To prevent damage, adjustments should always be made while rod is fully extended and no load applied.
